

Mobile App Publishing Instructions

Instructions for final project app publishing and repository structure

Dear Students,

Those students who have submitted their final projects should carefully read and follow these instructions.

I have reviewed the submitted project publishing links so far, and most students have made the same mistake while publishing their mobile apps. Uploading only the project code, a few screenshots, and basic instructions is not enough.

Your published project should look like a professional mobile app portfolio. Anyone who opens your project link should immediately understand what your app does, how it works, how it looks, and how they can install it using the APK file.

You are required to update your published project according to the following structure.

Required Project Structure

Your published project or repository should follow this structure:

```
Project-Name/  
├── app/  
│   └── Complete Android project source code  
├── screenshots/  
│   ├── splash_screen.png  
│   ├── login_screen.png  
│   ├── signup_screen.png  
│   ├── dashboard.png  
│   └── feature_screen.png  
├── apk/  
│   └── AppName.apk  
├── docs/  
│   ├── privacy_policy.pdf  
│   └── user_manual.pdf  
├── README.md  
├── LICENSE  
├── .gitignore  
├── build.gradle  
└── settings.gradle
```

Important Instructions

Your project should not only contain source code. It must also contain proper documentation and presentation material.

You must add the following items:

1. Complete Android project code
2. Properly written README.md file
3. App screenshots
4. APK file for installation
5. Privacy policy document, if applicable
6. Clear installation instructions
7. Features of the app
8. Technologies used in the project
9. Developer/student information

README.md File Structure

Most README.md files are written incorrectly. The README.md file is usually the first thing a person sees when they open your published project, so it must be written professionally.

Your README.md file should follow this structure:

```
# App Name

Write a short and attractive tagline about your app.

Example:
A secure Android application for student login, registration, and dashboard management.

## About the App

Write 4-5 lines explaining:
- What the app is about
- Who can use this app
- What problem it solves
- What main features it provides

## App Screenshots

Add screenshots of your app screens.

Example:

| Splash Screen | Login Screen | Dashboard |
|-----|-----|-----|
| ![Splash](screenshots/splash_screen.png) | ![Login](screenshots/login_screen.png) | ![Dashboard](screenshots/dashboard.png) |

## Features

- User signup
- User login
- Dashboard screen
- Data storage
- Firebase integration
- User-friendly interface

## Technologies Used

- Java / Kotlin / Flutter
- Android Studio
- XML
- Firebase
- Gradle

## APK Download

Add the APK file link here.

Example:
[Download APK](apk/AppName.apk)

## How to Install the APK

1. Download the APK file.
2. Open the APK file on an Android mobile phone.
3. Allow installation from unknown sources if required.
4. Install and run the application.

## How to Run the Project

1. Clone or download this project.
2. Open the project in Android Studio.
3. Sync Gradle files.
4. Connect Firebase if required.
5. Run the app on an emulator or Android device.
```

Demo Video

Add a short demo video link here, if available.

Example:

[Watch Demo Video](demo-video-link)

Privacy Policy

Add the privacy policy file or link here, if your app collects any user information.

Example:

[View Privacy Policy](docs/privacy_policy.pdf)

Future Enhancements

- Add more features
- Improve UI design
- Add admin panel
- Add notifications
- Add database reports

Developed By

Student Name
Class / Semester
Department Name

GitHub: Your GitHub Profile Link

LinkedIn: Your LinkedIn Profile Link, if available

Final Note

Students can publish their mobile apps on any suitable platform they want, such as GitHub, Google Drive, Firebase Hosting, personal portfolio websites, or any other platform allowed by the instructor.

However, the published project must have a proper structure. It should include the app code, APK file, screenshots, README file, installation guide, features, technologies used, privacy policy if required, and developer information.

GitHub or any other publishing platform should not be treated only as a place to upload files. It should present your project like a professional app portfolio.

A weak published project contains only source code and incomplete instructions.

A strong published project contains source code, screenshots, APK file, proper README.md, installation guide, features, technologies used, privacy policy, and developer information.

All students must update their published projects according to the above structure before final evaluation.
